

CS-1 & CS-2: Condensate Overflow Prevention Pipe Switches

The CS-1 (primary or auxiliary lines) and CS-2 (auxiliary) are designed to cut power to an air conditioning system in the event a clog in the condensate drain line occurs. Both products use a state of the art magnetic reed float switch with an integrated red LED indicator light notifying the home owner and/or service technician that the switch has activated, cutting off power and reducing the risk of a flood and water damage. Many features are designed into the product including a pull-to-test lever for verifying correct installation, and internal surge protector. The product is compact allowing installation into tight spaces and the insert card is bilingual in English and Spanish. Both units are available in quantities of 10.
